Automated Business Workflow using Deluge Scripting

Application Testing and Debugging — Vehicle Service & Repair Request Form

Shrivarthini

1. Aim

To design and implement an automated business process workflow within the Zoho Creator application using Deluge scripting, and to successfully conduct application testing and debugging to verify real-time execution.

Objectives

- To configure a form-level event trigger that automatically executes actions upon a successful record creation.
- To write custom backend logic using Deluge syntax to send automated email confirmations to customers who submit a vehicle service request.
- To perform end-to-end debugging and live testing to ensure data accuracy and workflow reliability.

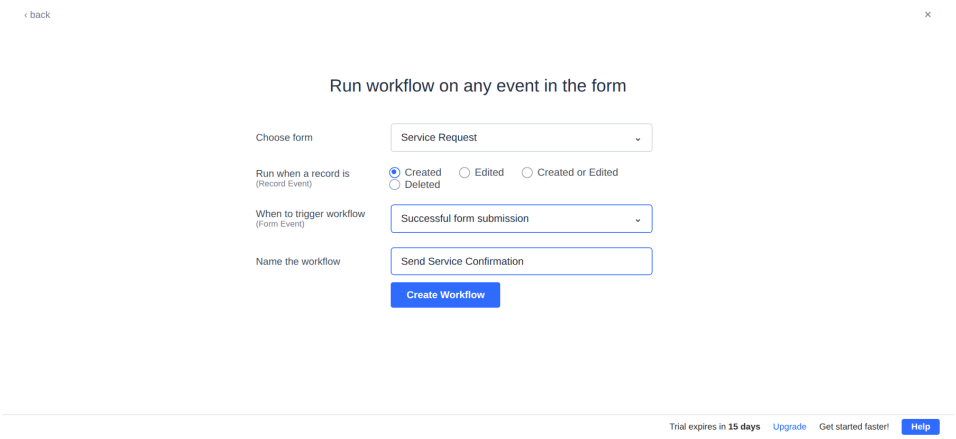

2. Procedure

Step 1: Initiating the Workflow Configuration

1. Open the Zoho Creator application in Edit mode.
2. Select Workflows from the left-hand navigation panel.
3. Click on the Create New Workflow button to open the automation setup window.

Step 2: Defining the Trigger Parameters

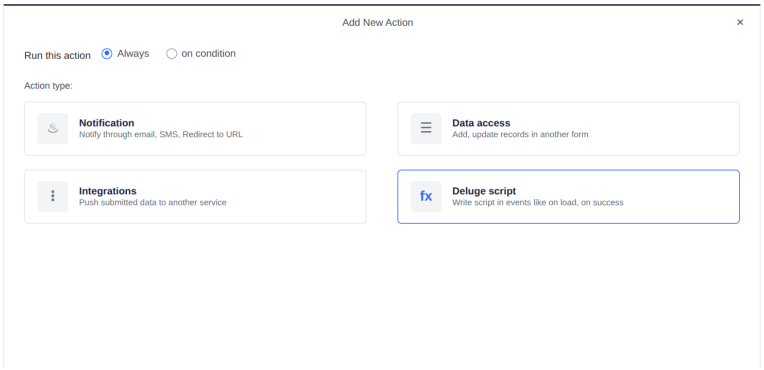

1. Under the Choose Form dropdown, select the target form: Service Request.
2. For the Record Event condition, select Created to ensure the automation runs only when a brand-new service request is submitted.
3. For the Form Event condition, select Successful Form Submission to trigger the backend actions right after validation.
4. Name the workflow clearly as Send Service Confirmation or Auto Process Service Request and click Create Workflow.

The workflow setup window shows the form selected, the Record Event set to Created, the Form Event set to Successful form submission, and the workflow named, ready to be created with the Create Workflow button.

Step 3: Setting up the Action Interface

1. Inside the newly created workflow diagram block, click the Add New Action button.

2. Select Deluge Script from the available option panels to launch the cloud-based Deluge code editor workspace.

Step 4: Developing the Deluge Script

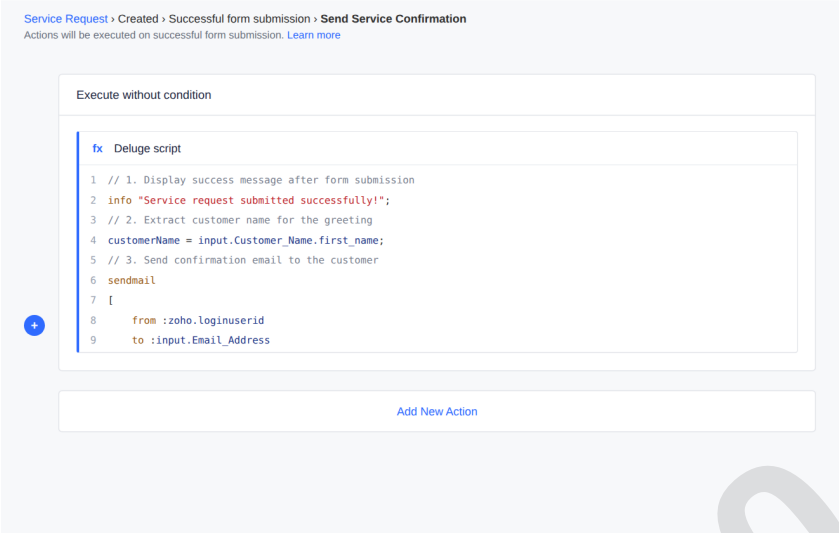

1. Write or configure the backend code inside the editor using Zoho's proprietary Deluge syntax.

2. Implement a sendmail function block using system variables (zoho.loginuserid) to establish secure routing between the sender and the recipient.

3. Define strict parameter pairs within the bracket block, ensuring correct spacing for tags (from:, to:, subject:, message:).

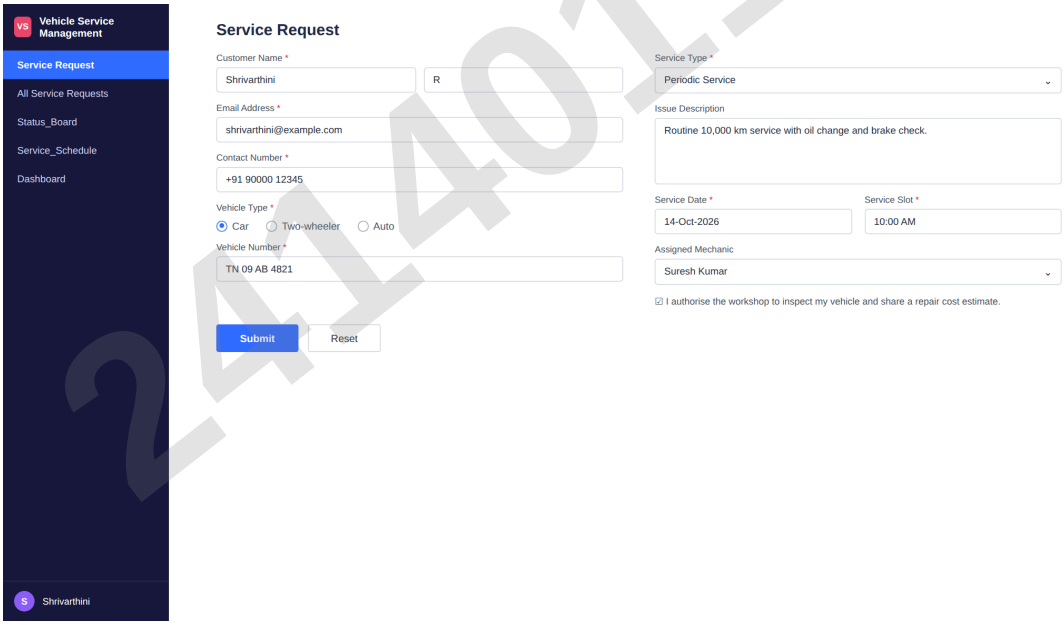

241401100

Step 5: Compiling and Saving

1. Review the code to eliminate syntax errors, mismatched brackets, or missing string quotation marks.
2. Click the blue Save button in the lower right corner to compile the code and successfully push the workflow script live.

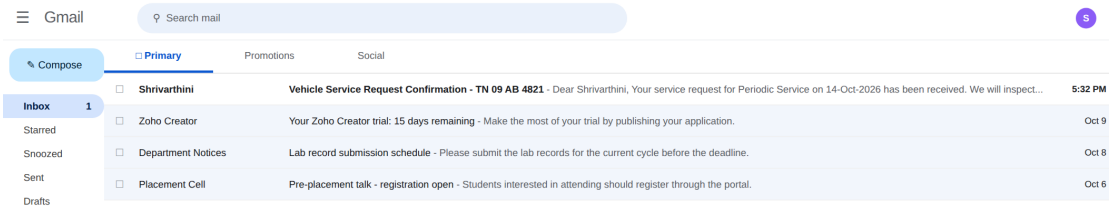

Step 6: Executing Live Application Testing

1. Switch the application from the editor environment to the live User View.
2. Open the live Service Request form.
3. Populate all fields with mock data and input a valid, accessible test email address.
4. Click the form's Submit button.

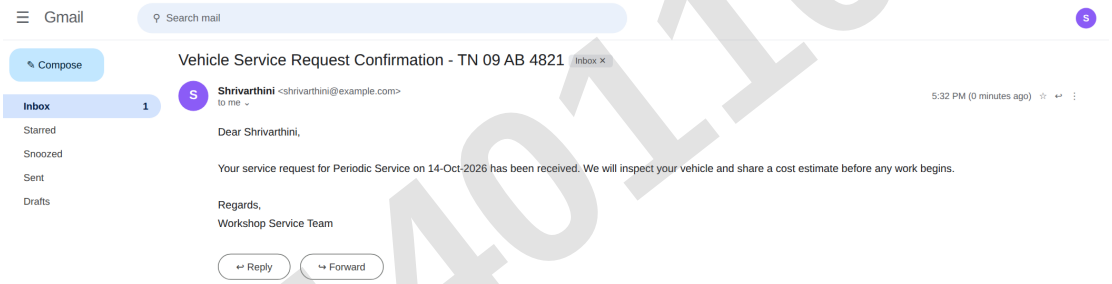

241401100

Step 7: Validation and Debugging Analysis

1. Verify the initial browser response to confirm the record was successfully added to the database.
2. Log into the target email client inbox.
3. Check the primary inbox and spam folder to confirm that the automated "Vehicle Service Request Confirmation" email arrived successfully without system delay.

3. Output

241401100

Workflow Activation: The back-end automation trigger was successfully mapped to the Service Request form's submission event without any compilation or system errors.

Script Validation: The written Deluge code passed Zoho Creator's logical syntax checks and successfully saved to the application architecture.

Live Execution Verification

- Filling out and submitting the live user form correctly generated a new record database entry.
- The backend script triggered instantaneously upon form submission.
- A real-time, automated "Vehicle Service Request Confirmation" email was successfully routed and delivered to the registered login inbox.

Result

The successful execution of this project demonstrates the power of low-code automation within the cloud ecosystem. By designing a targeted backend workflow and using Deluge scripting syntax to send automated confirmations, the Vehicle Service & Repair Request Management application has transitioned from a passive data repository into an active management system that acknowledges every customer request the moment it is submitted.
